ABSTRACT EP 940760 A1

An electronic wallet (100) is capable of storing at least one of a
financial information and a balance. Additionally, the electronic wallet
(100) is capable of selective call receiving (200) a wireless message
including financial information relating to a balance and updating the
balance in response to the wireless message.

ABSTRACT EP 940784 A2

An electronic money storage apparatus includes that an amount of remittance p is determined on a remitting side (1100) and a receiving side (1200; 2101, 2201). A remitting apparatus (1100) obtains a remitter's transaction fee x and an amount y to be stored in a transaction fee storage area (2102). The remitting apparatus obtains a sum of p and x , i.e., $p + x$ from an electronic money storage area (1131; 2103), divides the sum into an amount y to be stored on the remitting side and an amount remained $p + x - y$, stores y in a transaction fee storage area (1132), and sends $p + x - y$ to the receiving side (2106). A receiving apparatus (1200) obtains a receiver's transaction fee z and an amount u to be stored in a transaction fee storage area (2202), receives $p + x - y$ (2203), divides $p + x - y$ into u to be stored on the receiving side and $p - z$ (2204), stores u in a transaction fee storage area (1232; 2206), and stores remaining electronic money $p - z$ in an electronic money storage area (1231; 2205), thereby the transaction fee can be collected while retaining anonymity between the remitter and the receiver and usability of electronic money in the processing of electronic money by use of an IC card or the like.

ABSTRACT EP 950968 A1

The objective of the present invention is to provide a mobile electronic commerce system that is superior in safety and usability. The mobile electronic commerce system comprises an electronic wallet 100, supply sides 101, 102, 103, 104 and 105, and a service providing means 110 that is connected by communication means. The service providing means installs a program for an electronic ticket, an electronic payment card, or an electronic telephone card. The electronic wallet employs the installed card to obtain a product or a service or entrance permission. The settlement process is performed by the electronic wallet and the supply side via the communication means, and data obtained during the settlement process are managed by being transmitted to the service providing means at a specific time. A negotiable card can be easily obtained, and when the negotiable card is used the settlement process can be quickly and precisely performed.

ABSTRACT EP 917120 A2

The present invention provides apparatus, methods and systems for information and financial banking. Apparatus of the present invention include virtual wallets which allow for information and financial banking including payment mechanisms; identity authentication mechanisms; personal information; and electronic artifacts. Methods and systems of the present invention include information and financial banking methods utilizing virtual wallets. A preferred virtual wallet comprises a locally residing portion and a server residing portion. An interface is provided for communication between the two portions of the wallet.

ABSTRACT EP 851643 A2

A wireless receiver having a first and second housings one of which contains a wireless signal transmission and receiving means. The other housing preferably contains a power supply and possibly a battery back-up for use in the event of a cut in the power supply. The two housings are hinged together. They are relatively movable between one position in which the two housings depend one from another so as to be mounted upon a vertical wall and another position in which the two housings are disposed one behind the other for supporting upon a horizontal surface. Preferably, in the position for mounting upon a wall, the two housings provide rear planar surfaces which are coplanar and in the other position for mounting upon a horizontal surface the two housings provide planar support surfaces for supporting them upon the horizontal surface. It is also preferable that these two support surfaces, when the housings are in a position for hanging vertically, lie closely adjacent, are parallel and confront each other so as to give the impression that the receiver is a single housing construction. Similarly with the housings in the other relative positions other surfaces confront and lie parallel to each other also to give the single housing impression.

ABSTRACT EP 833285 A2

A method of and a product for generating electronic monetary tokens that support off-line transactions while preventing double-spending. Generation of electronic token halves by a financial services provider begins in response to a request from a buyer to generate electronic monetary tokens to be used with an identified seller. First, the financial services provider generates a multiplicity of electronic monetary tokens (1014). Second, the provider splits each electronic monetary token into two electronic token halves (1020, 1022) and associates with each the same serial number (1024). These electronic token halves when combined recreate the electronic monetary token from which they were generated, but by themselves neither electronic token half has any value. Nor can either electronic half by itself be used to create the electronic monetary token without the token half's mate. After splitting all of the electronic monetary tokens, the services provider assigns a half of each electronic token to the seller (1026) and the other half of each electronic token to the buyer (1028). The buyer and seller can now engage in multiple transactions off-line of the financial

services provider.

ABSTRACT EP 793205 A2

An electronic wallet (31) includes a plurality of operating keys (317) at least having a plurality of numeric and calculation keys, a display part (312) for displaying thereon electronic money information and IC card state information, at least one independent function switch (3191, 3192) in addition to a power switch (318), a plurality of control keys (3500) for operating the electronic money information stored in IC cards (10, 10') and the IC card state information, and a plurality of function keys (3501) having a plurality of function level layers (3502, 3503) having a plurality of tasks, for selecting the plurality of tasks having the respective function level layers. Thereby the electronic wallet can have many functions. Further, a modem unit (321), which is removably mounted to card slots (3151, 3161) of the electronic wallet, is provided with a through opening (3162) to communicate with the card slots and a modular jack (3212) to be connected to a communication line (323). Since a user can insert the IC card into the electronic wallet from the card slots with the modem unit already mounted to the card slots, handling of the electronic wallet is convenient upon transfer of the electronic money through the communication line. In addition, the user can insert the IC card into the electronic wallet which is still connected to the communication line.

ABSTRACT EP 793204 A2

A reader/writer for electronic money storing devices (10A, 10B) used to transfer electronic money among multiple electronic money storing devices (10A, 10B), the reader/writer having on the main body (101) thereof the formation of slots (104, 105) for putting electronic money storing devices (10A, 10B) into the reader/writer, money selecting keys (111) used to enter an amount of money to be transferred, and display means (106) for displaying the amount of money entered with the money selecting keys (111). The money selecting keys (111) have their keytops shaped so as to evoke the association of bank notes and coins, so that people who are not familiar with electronic appliances can enter amounts of money easily and surely.

ABSTRACT EP 724238 A1

The present invention provides a card apparatus for executing financial transactions, comprising:

- processor means for executing authorization routines and certain financial transactions, at least including prepaid transactions off-line, and loading transactions on line directly or indirectly with an issuer computer of an issuer company which issues said card apparatus; and
- memory means for storing data into said card apparatus, at least including a first purse memory part for storing a purse value of a fixed amount as agreed upon between the issuer computer and the user of said card apparatus, and a second authorization memory part for storing an encoded authorization number for authorizing a load onto said card when the user has entered his/her personal authorization number.

ABSTRACT EP 713198 A2

A system comprises an electronic ticket vending and refunding device (1) retained by a ticket publisher, a terminal device (3) having a data input device (19), a data display device (18), and a data transmission and reception device, etc. which are operated by a purchaser, and an electronic ticket storage device retained by the purchaser, and the vending and refunding device and the terminal device are connected by a communication line such as a telephone line, and the storage device and the terminal device can be connected in contact or non-contact, and transmission and reception of data between the vending and refunding device and the storage device are executed by electronic money and an electronic ticket which are electronically signed, and a trouble of sending and receiving of an electronic ticket and electronic money is prevented by recording the transaction history as required. ABSTRACT EP 396009 A2

A flat and foldable electronic appliance which comprises a generally rectangular first flat casing having a pocket defined therein for accommodating a card for expansion of functions; a generally rectangular second flat casing similar in shape to the first flat casing and having a plurality of operating keys; a bridge member including at least two hinge joints for pivotably connecting the first and second flat casings together, one of the first and second flat casing being pivotable between folded and unfolded positions relative to the other of the first and second flat casings; and a generally cylindrical battery chamber provided on a portion of the bridge means other than the hinge joints. The generally cylindrical battery chamber is of a volume sufficient to accommodate therein at least one AA-size battery for powering electric and electronic circuits in the appliance and has a peripheral wall which is so curved as to follow the path of movement of such one of the first and second flat casings relative to the other of the first and second flat casings.

ABSTRACT EP 257648 A2

An IC card (10), as a portable medium, has an oscillator (34) for
generating a low-frequency clock signal for timepiece. A display clock
(103) for display is provided for counting the clock signal. The time
based on a count carried out by the display clock (103) is displayed on
the IC card (10) a display section (13). In this case, the count of
the display clock (103) can be changed, as appropriate, by using keys on
the keyboard (12) provided on the IC card (10). The IC card (10)
also incorporates a transaction clock (102) for counting the clock
signal. The count carried out by this transaction clock (102) is used to
indicate the standard time. A count carried out by the transaction clock
(102) cannot be altered by use of the keys of the keyboard (12). The
clock for time display may be the transaction clock (102) allowing an

access of the keyboard (12). The time for setting a term of validity and the key for encoding may be provided by the transaction clock (102) rejecting an access by the keyboard (12) and providing the time equal to that of other cards.

ABSTRACT EP 950968 A1

The objective of the present invention is to provide a mobile electronic commerce system that is superior in safety and usability. The mobile electronic commerce system comprises an electronic wallet 100, supply sides 101, 102, 103, 104 and 105, and a service providing means 110 that is connected by communication means. The service providing means installs a program for an electronic ticket, an electronic payment card, or an electronic telephone card. The electronic wallet employs the installed card to obtain a product or a service or entrance permission. The settlement process is performed by the electronic wallet and the supply side via the communication means, and data obtained during the settlement process are managed by being transmitted to the service providing means at a specific time. A negotiable card can be easily obtained, and when the negotiable card is used the settlement process can be quickly and precisely performed.

... time.

One way to improve the security of credit card transactions would be to use **smart cards** instead of magnetic stripe cards. For example, a Personal Identification Number (PIN) **code** could be required to allow access to account information stored on a card. Such a PIN **code** should provide adequate user authentication protection.

However, it is not possible to make a **smart credit card** purchase over existing phones, because the information stored on the smart card has to be...enters into the mobile phone 14 (e.g., using the phone's keypad) a PIN **code** for the **smart card** selected for the payment transaction, and the ticket price and reference (identification) number provided by... the reader (and ultimately to the data bus controller section of the wallet). Alternatively, the **smart card** can convey a particular **code** from its communication protocol to the **smart card** reader (and thus to the controller section).

Consequently, any remotely located equipment that makes a...aspects of the present invention, a copy of the payment transaction remains stored on the **smart card** 125 in the wallet 112, and pertinent account information is **encrypted**, signed electronically, and transmitted via the data channel.

Additionally, in another embodiment, the local data...

...card wallet. In this regard, the present invention can employ a math processor in the **smart card** wallet, which can be used for data **encryption** /decryption purposes (e.g., employing RSA, DES, etc.). In fact, such a math processor can...

Detailed Description

Claims

English Abstract

A value transfer system using **integrated circuit cards** for exchanging electronic cash in off-line transactions employs **cryptographically** secure message protocols. Cards are loaded each with two schemes from a series and interaction...

Detailed Description

... security measures included in their manufacture and programming make it virtually impossible to counterfeit the **smart cards**.

Interception and duplication of the value transfer messages is prevented by **cryptographically encoding** messages exchanged in a transaction. In spite of the extremely high security levels achieved by...

...further programmed to identify and use, when coupled in a pair to exchange value between **electronic purses**, the older or oldest usable common **cryptographic** security scheme of the purse pair and to inhibit thereafter as superceded any older cryptographic...to which to be switched in sequence, in a preferred embodiment of the invention each **purse** is programmed with **two successive cryptographic** security schemes in the sequential series.

Preferably each **cryptographic** security scheme comprises at least one cryptographic algorithm and at least one cryptographic key and...

...because they combine the algorithms of different systems or because the keys are different.

Successive **cryptographic** schemes in the series are not necessarily different. It may be desirable to force current **smart cards** towards obsolescence by making them switch to a new **cryptographic** scheme even though it is the same as the old one. Thus, in one embodiment...

...scheme of the series in either purse.

Furthermore, selected ACD's may be provided with **two electronic purses** programmed with respective and different **cryptographic** security schemes, said selected ACD's being programmed, on being coupled to

another ACD, to...

...between the purses, said value exchange being effected by exchange of messages secured by a **cryptographic** security scheme, wherein selected ACID's are provided with **two electronic purses** programmed with respective and different **cryptographic** security schemes, said selected ACID's being programmed, on being coupled to another ACID to...With this arrangement it is possible to provide a cut-off strategy for a particular **cryptographic** scheme or set of schemes. By providing selected purses, for example retailers and banks, with **dual purse** smart cards (ACID's), one purse having the old schemes and the other purse having...8 and a unique purse identifier at 9. Security is maintained by the use of **cryptographic** schemes and this **purse** holds **two** schemes. Scheme A has algorithms at 10 and a set of **cryptographic** keys at 11. Scheme B has algorithms at 12 and a set of cryptographic keys...

...whether this switch has taken place. Thus, by reading bytes 15 to 17 the particular **cryptographic** scheme currently in use by the **purse** can be determined.

When **two purses**, X and Y, communicate for a value transfer the security schemes used are determined by...EEPROM of one such ICC is shown in Figure 4 at 21. The EEPROM has **two purses** 22 and 23, each with two **cryptographic** schemes.

In the event of a security breach, the **two purses** would have schemes belonging to an "old" and a "new" series and the two series...

Claim

... further programmed to identify and use, when coupled in a pair to exchange value between **electronic purses**, the older or oldest usable common **cryptographic** security scheme of the purse pair and to inhibit thereafter as superseded any older cryptographic...

...3. A value transfer system as claimed in either of the preceding

claims wherein each **purse** is programmed with **two** successive **cryptographic** security schemes in the sequential series.

4. A value transfer system as claimed in any...

...as claimed in any of the preceding

claims wherein selected ACID's are provided with **two electronic purses** programmed with respective and different **cryptographic** security schemes, said selected ACID's being programmed, on being coupled to another ACD to...

...between the purses, said value exchange being effected by exchange of messages secured by a **cryptographic** security scheme, wherein selected ACID's are provided with **two electronic purses** programmed with respective and different **cryptographic** security schemes, said selected ACID's being programmed, on being coupled to another ACD to...

Le porte-monnaie Zlectronique/
FRANCE: FIRST **ELECTRONIC WALLET** TEST IN TOURS
Le Figaro (XMV) 30 Sep 1999 p.49
Language: FRENCH

MonZo, the first **electronic wallet** test in France, was presented in Tours <western France> on 29 September 1999. The operation, which involves seven banks, will help the **smart card** based system take over from banknotes and coins for the everyday expenses by people. Shopkeepers are said to have accepted to pay a commission worth 0.9% of each operation. Though another **two electronic wallet** projects are announced (Mondex, tested in Strasbourg, and ModZus, tested in the Paris area), France is quite delayed in the issue.

Bull scores with football smartcard
BELGIUM: FOOTBALL ASSOCIATION ADOPTS SMARTCARD
Computer Weekly (CRW) 22 Oct 1998 p. 4
Language: ENGLISH

The Proliga Belgian football association has signed up to an anti-hooligan football smartcard scheme using the <French company> Bull Scot 65 micro-processor **card**. The **smartcard** is used to buy the ticket and can be deactivated if the fan causes trouble. Also, the card **doubles** as an **electronic purse** and a loyalty card. Germany and the Netherlands already have similar schemes, and the UK football league has indicated it wants to be kept informed of developments, but does not intend to introduce the scheme at present.

La Caixa y Banco Sabadell toman posiciones en el monedero electronico

SPAIN: BANKS ONE STEP AHEAD OF **SMART CARDS**

Expansion (EXN) 24 Jan 1996 p.16

Language: SPANISH

In anticipation of the increased use of **electronic purse** cards, banks in Spain's region of Catalunya, Banco Sabadell and La Caixa, are looking at how to get their piece of the pie. Public transportation is the answer. La Caixa, which has 30,000 **smart cards** in circulation in Catalunya, has signed an agreement regarding the use of their system with the public transportation system in the city of Granollers. La Caixa plans to expand its technology throughout the entire region in six months' time. Banco Sabadell is expected to sign a similar agreement with regional authorities and town halls to implement the 4B **electronic purse** system on buses in **two** other regional locations.

Porte-monnaie electronique a Wavre et a Louvain

BELGIUM: **ELECTRONIC PURSE** TESTED IN **TWO** CITIES

L'Echo (EB) 20 Jan 1995 p.4

Language: FRENCH

Banksys is to test a new system of **electronic purse** in Wavre and Louvain, Belgium. The system, called Proton, is to be implemented on 18 February 1995. In total, 450 shops in Wavre and 750 in Louvain will be equipped with the system, which will enable clients to pay their purchases with a **smart card** loaded with a maximum value of BFr 5,000. The codeless card will then be reloaded in cash dispensers or in special terminals. If the test is successful, the system may be extended to the whole of Belgium. Banksys already manages the electronic payment system of Belgian banks.

AVS introduces Bull CP8 **smart card** for Thai banks

THAILAND: AVS LAUNCHES BULL CP8 **SMART CARD** HERE

Bangkok Post (XBN) 26 Oct. 1994 P.5 Post Database

Language: ENGLISH

In Thailand, Advance Vision Systems (AVS) Co, a distributor of Bull CP8 Co,

has launched a Bull CP8 microcomputer card in the country, targeted specifically at local banks to replace all existing **cards** used today. The **smart card** comes with a microcomputer chip with a 2-64 KB RAM and ROM for accessing data, a picture, a finger print and a signature of the owner. It also meets up the ISO 7816 standard. The card can be used as a credit **card /debit card** and **doubles** up as a **electronic purse**. Each card costs between B 100 to B 1,000 depending on its memory.

Language: English Document Type: Conference Paper (PA)

Treatment: Practical (P)

Abstract: A new monetary system is described. It is based on **electronic wallets** which look like pocket calculators. The **electronic wallet** is energized by a battery, has a display and a keyboard. **Two wallets** can communicate via infra-red light signals. The **wallets** store unforgeable (**electronic**) money and payment can be made, in seconds, from one wallet to another (or to a point of sale or bank terminal). The wallet is updated, by connecting it to a bank terminal or through a telephone. During the update, the transactions stored in the wallet are transferred to the bank, the wallet is loaded with a new sum of money, the time (including date), invalidation date and cryptographic data. The owner of the wallet is the only person who can use it since he alone knows the password (PIN). In addition to paying and receiving, the owner can review the balance and past transactions performed since the last update. A cryptographic protocol is used to prevent forgery of money and fraud. The protocol was proved to be free of error and secure. It uses a public-key signature cryptosystem which allows a relatively fast authentication of signatures. (14 Refs)

Web entrepreneurs find ways for teens to speed -- Prepaid credit cards. Parental approval of purchases. These are a few of the Net's alternate payment systems

Pugh, Tony

The Philadelphia Inquirer , June 1, 2000 , v172 n1 pF2, 1 Page(s)

Company Name: MasterCard; Visa; DoughNet.com; iCanBuy.com; FlashCard

Reports that Internet startups are leading the rush to provide alternative payments systems that let teens and anyone else shop online with a credit card. Notes that in the near future, Western Union will introduce FlashCash, which will let people purchase items online and then pay in cash at any Western Union outlet within three days. States that DoughNet.com and iCanBuy.com are **two e-wallet** Web sites that let users bank and even donate to charities online using prepaid accounts. Adds that sites such as Cybermoola.com and InternetCash.com offer prepaid Internet spending cards and accounts that work like phone calling **cards** or **debit cards** . Cites Cobaltcard and PocketCard that are among a growing number

of prepaid shopping cards that carry a Visa or MasterCard logo, and both cards set up accounts with funds transferred online from bank accounts. Contains one sidebar. (sps)

Title: A prototype KPS and its application- IC card based key sharing and cryptographic communication

Author(s): Matsumoto, T.; Takashima, Y.; Imai, H.; Sasaki, M.; Yoshikawa, H.; Watanabe, S.

Author Affiliation: Fac. of Eng., Yokohama Nat. Univ., Japan

Journal: Transactions of the Institute of Electronics, Information and Communication Engineers E vol.E73, no.7 p.1111-19

Publication Date: July 1990 Country of Publication: Japan

CODEN: TIEEEV ISSN: 0913-574X

Language: English Document Type: Journal Paper (JP)

Treatment: Applications (A); New Developments (N); Practical (P)

Abstract: Demonstrates and confirms that a large-network-oriented key sharing method called the key predistribution system (KPS) is really practical and useful for supporting end-to-end **cryptographic** communication, by presenting a prototype implementation of KPS using special **IC cards** and its application to facsimile systems. This prototype can build a secure channel over any ordinary facsimile network using the following types of equipment: (1) an IC card implementing a linear scheme for KPS and the DES algorithm, (2) an adaptor-type interface device between the IC card and a facsimile **terminal** with no **cryptographic** function, and (3) a device for each managing center of KPS. A digital wallet is software that enables online shoppers to safely purchase goods. It holds consumer's sensitive data such as names, credit card numbers, shipping and mailing addresses, and other personal information online. Consumer's information is encrypted by a private software code. Merchants are also protected against fraud. After an initial purchase from a merchant, in which the consumer has filled out the merchant's Web form with payment and shipping information, the free digital wallet service appears. The customer then enters a user name and a password for future access to the wallet for that particular merchant. When the customer returns to that merchant's site for a purchase, his digital wallet will list the customer's stored information. The customer enters his own password and the purchase is completed. There are **two** types of digital **wallets**, client-side and server-side. Client-side wallets requires users to download and install software and they then retain control of their information, locally, or on their computer. Server-side wallets require users to fill out their personal information, which then resides on the server of a financial institution or wallet vendor. Major software vendors such as Microsoft, Sun Microsystems, and America Online are endorsing E-Commerce Modeling Language, or EMCL, a new standard to give merchants a way to collect electronic data for shipping, billing, and payment.

ClickBook is an easy to use utility that can convert printed output into a variety of portable formats. The software works with any Windows application and any single-sheet feed printer to support eighteen printed formats ranging from full-size **double**-sided to **wallet**-sized books with twenty-four pages compressed onto a single sheet of paper. ClickBook works with the existing Windows print driver, but can distinguish between different printers using a step-by-step testing process. The software scales pages to fit printer formats at print time, and a Guide Sheet

includes instructions for cutting, folding, and stapling books. ClickBook is great for saving paper and making any document easy to handle.

Several new Web sites, ebates, CarsDirect, RocketCash, and Riffage.com expand online shopping capabilities. The ebates site offers a free account and e-mail which can be used to receive rebates from online merchant partners like Amazon.com, CDNow, and Borders.com. Savings can sometimes be substantial, though a downside is that ebates pays only once per quarter. The goal of ebates is to become the ultimate Web-shopping portal, with future plans to refund electronically rather than quarterly, increase referral fees from merchants so as to pass along savings to customers, and add a gift reminder service. CarsDirect helps users purchase most major makes and models of autos online, without the intervention of a dealer. Users can configure their auto with an array of options, then receive the sticker price, invoice, and price quote from CarsDirect. The auto is delivered to an area dealership, or, in LA and San Francisco, delivered right to the driveway. RocketCash is an **electronic wallet** for teens lacking credit **cards**. An online account is **debited** when purchases are made, with graphics showing account levels throughout purchases. Another site that may prove popular with teens, Riffage.com, provides new, unsigned bands with home pages, chatrooms, and bulletin boards, as well as letting fans create playlists. Riffage.com will also help such bands sell their related merchandise, like T-shirts.

A host of new Web services and technologies, such as Priceline.com, Dell Computer, **smart cards**, and **digital wallets**, portend an increasingly

futuristic, Web-based way of buying and selling goods. Already, services like Priceline.com are popping up that accept bid-type offers on various services, such as airline tickets and hotel packages. Dell Computer's innovative way of eliminating middlemen and the costs associated with them by selling PCs directly to consumers and businesses is dramatically reducing prices. **Digital wallet** technologies, such as those developed by DEC/Compaq, IBM, and Microsoft, are more popular overseas than in the United States. **Smart cards** similarly promise to simplify the handling of electronic money, but users are hard pressed to find the cards or the businesses that support it.

A panel of financial services experts recently dispelled the notion that emerging electronic bill payment technologies and services will likely replace traditional cash, check, and credit card services in the near future. Despite a growing demand among consumers to use e-payment systems such as **smart cards**, e-checks, and **electronic purses**, a lack of industry standards and weak value (in comparison to traditional payment methods) are keeping the technology from progressing as quickly as consumers would like it to. Similarly, the establishment of traditional credit card payment e-commerce systems online makes it tougher for businesses to strip it all down and start over after conquering consumer fears over online credit card security and fraud. Experts predict that credit cards will remain the dominant payment method for the Web for the short to medium term future.

Despite early setbacks in market growth, **digital 'wallet'** software and services, such as CyberCash Agile Wallet and CyberCash InstaBuy from CyberCash, are coming back now as convenient server-based ways for online shoppers to buy goods without having to repeatedly enter account and credit card information at every e-commerce stop. CyberCash-hosted servers can accept one-click online transactions that are deducted from the customer's account without entering any additional information for a purchase. Some industry analysts view **digital wallets** as a logical stepping stone to physical **smart -card** technology products, though many still feel either approach is still far from being polished and stable enough to handle online transactions. Of particular concern to online shoppers is the prospect of storing financial information on a remote site's server.

As studies show Internet-based purchases doubling in the past nine months, the once-abandoned electronic commerce area of micropayment systems are showing a resurgence in business potential. IBM, Compaq Digital, and British Telecom are all ready to unleash micropayment systems based on **smart cards**, software, or both. The sluggish startup of many **smart card** and micropayment software ventures has not at all slowed down the Web's explosive e-commerce growth; many experts feel this slow growth is only temporary. After a few years of limited experience with this genre of software, developers are refining micropayment applications and a few tentative **smart card** payment systems are being put into place. Other advances, such as the Common **Electronic Purse** Specification, will only further enhance the development and interoperability of **smart cards**.

CyberCash's CyberCoin and Secure Internet Payment Service, First Virtual Holdings' Internet Payment System, and IBM's Net.Commerce are electronic money products highlighted. CyberCoin is designed for small online monetary transactions from 25 cents to 10 dollars, and requires users to download an **electronic wallet**. The user then registers online to have identify validated. Banks supporting CyberCoin offer accounts that hold money transferred to the wallet, so the sum stays in the banking system's records. Other methods are credit-card purchases in which the seller's account is credited before the buyer's. NetCheque, an electronic check system, works the same way. Digicash's E-Cash and **smart cards** debit the buyer's account with money for later use. Mondex International's **smart card** system uses a wallet about the size of a pocket calculator that downloads small quantities of cash to a **smart card**. Transactions are anonymous, and Mondex readers can be attached to cash registers, kiosks, and computers. Automated Teller Machine (ATM) systems everywhere could conceivably also be updated for use with a PC Card reader to pay for an online transaction. All such systems require hidden, encrypted information to prevent hackers from getting at private financial information, and to ensure authentication of buyers and sellers over the Internet. An alternative method is First Virtual Holdings' acquisition of credit-card numbers over the phone, with a personal identification number issued to users, and transactions confirmed by e-mail.

Netscape Communications Corporation introduces Netscape LivePayment, an online cash register for processing Internet-based credit-card transactions. This product is cited for its unique simplicity and record-keeping capabilities. LivePayment further sets the stage for the introduction of electronic coupons, **smart cards**, and other conveniences described as **electronic wallet** functions. This and other online merchant technologies are scheduled for integration with an upcoming release of the Netscape Navigator scheduled for the end of the year (1996). Other details are provided.

ABSTRACT

PROBLEM TO BE SOLVED: To improve the usability as a prepaid card and further to make improvable the security, by transferring the deposit money amount from a 1st wallet to a 2nd wallet through personal certification in the case of a transaction using a transfer device but utilizing the utilization money amount for the 2nd wallet without requiring the personal certification in the case of a transaction using a utilizing device.

SOLUTION: The IC card 1 has a double wallet function composed of a 1st high- security wallet 1A requiring a password number and enciphering in the case of the transaction and a 2nd low-security wallet 1B not to require any password number and enciphering in the case of the transaction. A transfer device 2 is in the constitution freely attaching and detaching the IC card 1 and stores the amount transferred through the communication with a center system 3 of a bank or the like in the 1st wallet 1A of the IC card 1. A utilizing device 4 is in the constitution freely attaching and detaching the IC card 1 and provides various services corresponding to the amount stored in the 2nd wallet 1B of the IC card 1.

Abstract (Basic): JP 2000172796 A

NOVELTY - **Electronic wallet** has two card slots (3151,3161) for insertion and extraction of IC cards storing electronic

currency information. Card slots are equipped with card inserting inlet ports opened on front surface of **electronic wallet**.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for the operation method of **electronic wallet**.

USE - For electronic currency system.

ADVANTAGE - Enables to easily and conveniently carry the **electronic wallet** having thin shape. Enables to easily perform legible display on a liquid crystal display screen.

DESCRIPTION OF DRAWING(S) - The figure shows the perspective view of **electronic wallet**.

Card slots (3151,3161)

Abstract (Basic): EP 907154 A2

NOVELTY - When carrying out a high security transaction using a transfer device (2) a deposited amount is moved from a 1st purse area (1A) to a 2nd purse area (1B) via personal authorization using a code number. When carrying out a low security transaction via a device at the user's side, personal authorization is not needed, and a money amount for payment is executed with the second purse of the **IC card**.

USE - For providing an **electronic purse** system for handling **electronic cash** with an **IC card**.

ADVANTAGE - Improves the security of the **IC card** as a double structured **purse**.

DESCRIPTION OF DRAWING(S) - The drawing shows a block diagram showing an example of the **electronic purse** system.

Abstract (Basic): WO 9702548 A

The value transfer system includes several electronic programmed microprocessor application carrier devices (ACDs). Each of these has an **electronic purse** with a value store. The carrier devices can be coupled together in pairs so as to couple the purses and allow values to be exchanged by use of secured messages.

Each **purse** is programmed with **two** of a series of cryptographic security schemes. The older common security scheme is used by the purses and is then inhibited as superceded. Each purse has a memory region which stores an identifier for a security scheme being used.

USE - For electronic cash transactions such as receiving money from bank, exchanging cash in off-line transaction, or for retailers.

ADVANTAGE - Improved security due to time limit being applied to codes. Changes codes used as necessary.

ABSTRACT

PROBLEM TO BE SOLVED: To improve the usability as a prepaid card and further to make improvable the security, by transferring the deposit money amount from a 1st wallet to a 2nd wallet through personal certification in the case of a transaction using a transfer device but utilizing the utilization money amount for the 2nd wallet without requiring the personal certification in the case of a transaction using a utilizing device.

SOLUTION: The IC card 1 has a **double wallet** function composed of a 1st high- security wallet 1A requiring a password number and enciphering in the case of the transaction and a 2nd low-security wallet 1B not to require any password number and enciphering in the case of the transaction. A transfer device 2 is in the constitution freely attaching and detaching the

IC card 1 and stores the amount transferred through the communication with a center system 3 of a bank or the like in the 1st wallet 1A of the IC card 1. A utilizing device 4 is in the constitution freely attaching and detaching the IC card 1 and provides various services corresponding to the amount stored in the 2nd wallet 1B of the IC card 1.

Abstract (Basic): JP 2000172796 A

NOVELTY - Electronic wallet has two card slots (3151,3161) for insertion and extraction of IC cards storing electronic currency information. Card slots are equipped with card inserting inlet ports opened on front surface of electronic wallet.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for the operation method of electronic wallet.

USE - For electronic currency system.

ADVANTAGE - Enables to easily and conveniently carry the electronic wallet having thin shape. Enables to easily perform legible display on a liquid crystal display screen.

DESCRIPTION OF DRAWING(S) - The figure shows the perspective view of electronic wallet.

Abstract (Basic): WO 9702548 A

The value transfer system includes several electronic programmed microprocessor application carrier devices (ACDs). Each of these has an electronic purse with a value store. The carrier devices can be coupled together in pairs so as to couple the purses and allow values to be exchanged by use of secured messages.

Each **purse** is programmed with **two** of a series of cryptographic security schemes. The older common security scheme is used by the purses and is then inhibited as superceded. Each purse has a memory region which stores an identifier for a security scheme being used.

USE - For electronic cash transactions such as receiving money from bank, exchanging cash in off-line transaction, or for retailers.

ADVANTAGE - Improved security due to time limit being applied to codes. Changes codes used as necessary.

ABSTRACT

PROBLEM TO BE SOLVED: To simplify work about allowance payment by calculating the salary allowance of each attending and leaving work controlled person based on attending and leaving work information and giving the allowance to a corresponding attending and leaving work controlled person.

SOLUTION: An attending and leaving work terminal 1 is provided with a card reader-writer 8 which reads and writes data of an IC card 7 as an **electronic purse**, and an IC card 7 that is individually owned by

each attending and leaving work controlled person records his own identification code . When today's data is a payday for the attending and leaving work controlled person, the allowance that is calculated by a host computer 3 is automatically paid by adding the salary allowance of the attending leaving work controlled person to electronic cash data in the IC card 7 that is attached to the card reader- writer 8.

ELECTRONIC PURSE BALANCE DISPLAY SYSTEM

PUB. NO.: 08-287169 [JP 8287169 A]
PUBLISHED: November 01, 1996 (19961101)
INVENTOR(s): SAKAI KATSUAKI
YONEZAWA MEGUMI
APPLICANT(s): HITACHI LTD [000510] (A Japanese Company or Corporation), JP
(Japan)
APPL. NO.: 07-085087 [JP 9585087]
FILED: April 11, 1995 (19950411)

ABSTRACT

PURPOSE: To easily confirm the balance of an 'electronic purse' in safety by displaying symbols on a liquid crystal display panel provided on the surface of an IC card under previously set conditions when the balance is confirmed.

CONSTITUTION: On the surface of an **electronic purse** main body 1, the liquid crystal panel 2 for mark display at the time of the confirmation of the balance and set condition display at the time of display information registration, numeric keys, mark keys, and **code** keys 3 for data input, a connection terminal 4 for an external equipment, and a power switch 5 for turning ON and OFF the power source are constituted. When the user confirms the balance of the 'electronic purse' that the user carries, a password number is inputted by using the numeric keys provided on the IC card surface and a display button is pressed, so that a symbol is displayed on the liquid crystal display panel provided on the IC card surface according to previously set conditions. Consequently, the rough value of the balance of the 'electronic purse' can easily be confirmed in safety in any place.

Abstract (Basic): JP 2000132656 A

NOVELTY - A protection function releasing unit (18) releases a protection function which is recovered automatically by protection

function recovery unit (19). A releasing indication reception unit (17) is then provided to indicate reception of released protection function. Protection function enables usage of **IC card** by inputting a **code** number in terminal equipment of **IC card**.

USE - For e.g. **electronic wallet**, prepaid card etc.

ADVANTAGE - Settlement of price is enabled efficiently without damaging the protection function.

DESCRIPTION OF DRAWING(S) - The figure shows component of **IC card**.

Abstract (Basic): US 6058017 A

NOVELTY - The reinforcement structure (2120) laterally surrounds the IC module (2130) with space in between. The reinforcement structure in turn is surrounded by a semirigid body. The elasticity modulus of reinforcement structure is higher compared to that of the semirigid body.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for **smart card** manufacturing method.

USE - For e.g. plate-type, cap-type, washer-type reinforcement structure for protecting IC module in contact type and non-contact type **smart card** used as prepaid **debit cards** such as telephone **cards**, transit passes, **electronic purse**, subscriber cards such as ATM cards, credit cards, point-of-sale cards, loyalty scheme cards such as frequent flier card, security access and ID cards, health insurance and service cards, GSM cards, **encryption** /decryption cards.

ADVANTAGE - The reinforcement structure relieves stress on the IC module during bending and torsion of cards.

DESCRIPTION OF DRAWING(S) - The figure shows sectional diagram of **smart card**.

Abstract (Basic): WO 200021203 A1

NOVELTY - An ultrasonic acoustic signal **encoded** with information is sent to a computer (20) with an audible sound receiving and generating sub-system having a microphone (26).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) **smart card** terminal creating method;
- (b) electromagnetic radiation detecting method;
- (c) microphone emulating method;
- (d) coupler for audio channel;
- (e) computer networking method;
- (f) acoustic signal analyzing method;
- (g) pulse time of flight determining method

USE - For computer network components, electronic home appliances such as desktop, laptop computers, televisions, watches, personal digital assistant, organizers, electronic toys, electronic games, voice responsive appliances, wireless communication devices, answering machines and desktop telephones, **electronic wallets**.

ADVANTAGE - Allows electronic devices to communicate using input and output acoustic channels designed for communication with human users. Allows usage of **smart card** to be read by and written to, using standard computer hardware without requiring an installation of specialized hardware.

DESCRIPTION OF DRAWING(S) - The figure shows schematic illustration of computer and electronic device which communicate using sound waves.

Designated States (National): CA JP

Designated States (Regional): AT BE CH CY DE DK ES FI FR GB GR IE IT LU
MC NL PT SE

Abstract (Basic): WO 200008610 A1

NOVELTY - Processor (30) of an issuing unit (22) divides the ID codes on revocation list into multiple buckets by hash partitioning. Revocation vector representing distribution of ID codes within the buckets is transmitted to a transaction unit (24), which judges whether ID code of an IC card (26) gets divided into non-empty bucket indicated by revocation vector and judges card to be revoked IC card .

DETAILED DESCRIPTION - The revocation vector includes shared secret that is shared between the issuing unit nad the transaction unit.

INDEPENDENT CLAIMS are also included for the following:

- (a) disc for storing IC card offline verifying software;
- (b) transaction unit for offline verification of IC card ;
- (c) offline verification method for IC card

USE - For authenticating card by offline verification of IC card e.g. smart card , electronic wallet , PC card , smart disc.

ADVANTAGE - Enables quick transaction with minimized fraud and without rejecting legitimate card. Reduces telecommunication cost and bandwidth requirement for card verification by using small revocation vector. Facilitates usage of automated teller machine (ATM), kiosk, vending machine as transaction unit to decide that IC card is not on revocation list quickly and accurately without resorting to online verification process. Improves transaction speed by handling only revocation vector.

DESCRIPTION OF DRAWING(S) - The figure shows block diagram of electronic offline verification system.

US 5991749	A		21	G06F-015/30	Provisional application US 9620312

Abstract (Basic): US 5991749 A

NOVELTY - A service provider's CPU processes account and authorization information, in response to function **code** entered by user on keypad of cellular phase. The service provider CPU, identifies desired transaction and supplies personal ID number if needed. The desired transaction is authorized to determine different accounts involved and confirms completion of transaction.

DETAILED DESCRIPTION - The desired transaction involves a default amount at preset price and variable amount. An INDEPENDENT CLAIM is also included for a method for verifying identity and authorizing access to secured location.

USE - For collecting tolls of cellular telephones, **electronic wallet**, wireless PIN pad, contactless **smart card**, etc.

ADVANTAGE - Highly reliable and simple technique provides desirable results since an unauthorized user with closed cellular phone would need to know unique function **code**, account number and personal identification number (PIN) to complete the transaction and generate a confirmation number and thus transactions of unauthorized users are not performed.

DESCRIPTION OF DRAWING(S) - The figure shows the chart of the steps involved in computer tolling procedure.

JP 11272809	A		21	G06K-017/00	

Abstract (Basic): JP 11272809 A

NOVELTY - A display panel (2) displays the **IC card** balance information corresponding to the character **code** specified by an input unit (4). An arithmetic processor (8) controls the display panel for displaying the **IC card** information.

USE - For money information, premium point information **IC card** used in **electronic wallet** system.

ADVANTAGE - Displays required information at any time by key

operation. Restricts function of display panel key without performing complicated process, using balance indicator. Acquires data for display through provision of key, thereby avoids method like select file command from directory. Updates information stored in IC card using memory. DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of display device. (2) Display panel; (4) Input unit; (8) Arithmetic processor.

Abstract (Basic): JP 11066195 A

NOVELTY - The electronic terminal in a retail store transmits proof of transaction with a customer, after adding an identification number. The terminal in the bank verifies whether the claimed amount has been received from the identified store and forwards the amount to payment section terminal. DETAILED DESCRIPTION - The store terminal uses a secret key for **encryption** of amount and stores identification information. The bank terminal has disclosure key for decoding the information. Both receiving terminal and payment section terminal in the bank verify the claimed amount by decoding the **encrypted** information from the store terminal. INDEPENDENT CLAIMS are included for the following: electronic cash transfer system; recording medium storing program for electronic cash transfer method

USE - For retail store transactions using **electronic wallet**, i.e IC card and telephone circuit.

ADVANTAGE - Enables efficient distinguishing of amounts from retail store as it is based on retail store signature. DESCRIPTION OF DRAWING(S) - The drawing shows the block diagram of the electronic cash transaction system.

Abstract (Basic): EP 907154 A2

NOVELTY - When carrying out a high security transaction using a transfer device (2) a deposited amount is moved from a 1st purse area (1A) to a 2nd purse area (1B) via personal authorization using a **code** number. When carrying out a low security transaction via a device at the user's side, personal authorization is not needed, and a money amount for payment is executed with the second purse of the **IC card**

USE - For providing an **electronic purse** system for handling **electronic** cash with an **IC card**.

ADVANTAGE - Improves the security of the **IC card** as a double structured purse.

DESCRIPTION OF DRAWING(S) - The drawing shows a block diagram showing an example of the **electronic purse** system.

Abstract (Basic): EP 823694 A

The **smart card** comprises an **integrated circuit** with a processor having a memory. The memory is structured to comprises tickets (20). A ticket comprises an entitlement field (21) for storing data relating to the entitlement of the ticket.

A ticket further comprises a validation field (22) for storing data relating to the validity of the ticket, and a verification field (23) for storing data relating to a check of the validity of the ticket. Data is stored using a **code** containing a fixed number of set bits per group of bits. The **code** words have eight bits, and the set bits in each **code** word equal four.

USE - For tickets stored in **smart cards** and for using stored tickets. E.g. for **electronic purse**. Also for loyalty card or points card used by shops. Also for personal data such as medical record.

ADVANTAGE - Allows use of open tickets that is tickets which have non-predetermined validity date or time. Tickets can be securely stored.

Abstract (Basic): EP 813173 A

The system includes an **IC card** for storing electronic money information and information for giving transaction conditions using electronic money. **IC card** read/write device reads and writes information stored in the **IC card**. An input device inputs transaction information using electronic money. Standard information are stored for judging approval or disapproval of transaction desired by an owner of the **IC card**. Approval or disapproval of transaction inputted is decided by the input device on the basis of the information for giving transaction conditions which is read by the **IC card** read/write device and the standard information stored in the storage device. Electronic money information in the **IC card** is updated depending on the charge for the transaction on the basis of the information for giving transaction conditions when the decision by the deciding device is approval. An **encryption** key signal for decrypting **encrypted** data, and age information.

ADVANTAGE - Automatically prevents selling to minor certain item and disqualified transaction using discriminating age information.

Designated States (Regional): DE DK FR GB IT SE

US 5770846 A G06K-007/00

Abstract (Basic): WO 9730533 A

The method of determining the distance between two points on a storage medium involves determining the distance between two read apparatuses. The distance between two points is compared to the distance between the read apparatuses.

Preferably, the first point is detected using a leading read apparatus, whilst the second is detected at a trailing read apparatus. The jitter value is determined in response to detection of the second point at the first read apparatus. This jitter value represents the distance between the two points. The first point is detected at the trailing read apparatus and used to determine a reference value. The reference value is representative of the distance between the two points and is compared with the jitter value.

USE/ADVANTAGE - For authenticating credit, **debit cards**, **electronic purse cards**, cheques, driver's licences, identification card, uniform purchasing **codes** etc. Allows processing functions to be divided and performed by several different processing devices. Allows distance to be measured without need to control velocity of reader with respect to document.

Abstract (Basic): DE 19548581 A

The customer's **smart card** stores the accounting data for a financial transaction with a **code** for each service provider to whom payment is due. On loading the **electronic purse**, the loading data is transferred to an accounting centre, together with the card identification, and the **codes** and corresponding credit.

The accounting centre identifies the card owner's account and transfers the loading amount to a pool account. The sum of all the loading amounts during a given accounting period is calculated, and the service providers are each credited according to their percentage of all transactions.

The complete data set for every transaction may be stored on **smart cards** with sufficient memory.

ADVANTAGE - Reduces administrative effort and cost for financial transactions.

Abstract (Basic): WO 9702548 A

The value transfer system includes several electronic programmed microprocessor application carrier devices (ACDs). Each of these has an **electronic purse** with a value store. The carrier devices can be coupled together in pairs so as to couple the purses and allow values to be exchanged by use of secured messages.

Each purse is programmed with two of a series of cryptographic security schemes. The older common security scheme is used by the purses and is then inhibited as superceded. Each purse has a memory region which stores an identifier for a security scheme being used.

USE - For electronic cash transactions such as receiving money from bank, exchanging cash in off-line transaction, or for retailers.

ADVANTAGE - Improved security due to time limit being applied to **codes**. Changes **codes** used as necessary.

US 5581445	A		21	H05K-001/18	

Abstract (Basic): US 5581445 A

The semi-rigid card comprises a semi-rigid body having an upper surface and a lower surface. A first opening and a second opening are located in the upper surface of the semi-rigid body. The semi-rigid body has a first modulus of elasticity. A module has an electronic component and is disposed in the second opening of the semi-rigid body.

A reinforcement structure has a second modulus of elasticity which

is higher than the first modulus of elasticity. The reinforcement structure is disposed in the first opening of the semi-rigid body, and laterally surrounds the module.

USE/ADVANTAGE - For use as prepaid **debit cards** e.g phone cards, transit passes, **electronic purse**, subscriber cards e.g bank ATM cards, credit cards, point-of-sale cards, and loyalty scheme cards, health insurance and service cards, GSM cards and **encryption** /decryption cards. Reinforcement structure relieves stress on integrated circuit module during bending and torsion of card.

Abstract (Basic): WO 9632700 A

The payment system uses a **smart card** and a telephone system. The **smart card** is organised to hold money credits on it and to transfer these on command. The **smart card** (7) can be plugged into a conventional mobile telephone (4). The user can enter a PIN number via the telephone key-pad (5) and select options via the telephone display (6).

On user command the telephone transfers money credits via radio (8) to an electronic till (2). The receipt of money is shown on the till display and the till can return an electronic receipt. **Encryption** systems are used to provide security. The process can also be performed over a reader connected to the PSTN.

ADVANTAGE - Allows user to retain physical control of his 'wallet' at all times when paying for services.

KR 98702999	A			G06K-017/00	Based on patent WO 9628792

Abstract (Basic): WO 9628792 A

The processing system includes a terminal having a slot for inserting an **IC card** found, and a second slot for inserting a second **IC card**. The terminal calls a found processing centre on the basis of information read out from the found **IC card**, and transmits the information read from the second card to the centre. A processing **code** generated by the centre for the found processing is written into the second card, and the information in the found card is erased by the instruction from the centre.

Alternatively, the processing centre stores the information of at least the found **IC card** on the basis of the transmission signal from the terminal, and generates the processing **code** for the found processing. The instruction for erasing the information in the found card is generated, and the information of the second card transmitted from the terminal and the processing **code** are stored...

ADVANTAGE - Can easily recover information stored in found card without applying any burden to card finder, original card owner and card issuing party, and return information to owner.

Abstract (Basic): DE 4310580 A

On autoroute AS with lanes (SP1...SP3) signal bridge (SB) at toll station ZS, signal bridge SB carries infrared beacons (IRB), infrared communication link (IRK) illuminating comm's area KB. Also on (SB) is an infrared video camera (IVR), traffic radar (RD) and normal video camera (NV), forming auto identification and recording system (FIR).

The equipment is coupled to control and evaluation system (SAE) which performs data processing on inputs. An **encrypted** data transfer is performed between toll station ZS and car (FZ...), in which credit on a car-mounted processor **card** is **debited** for the passage through toll station.

USE - Traffic charging and toll systems.

Dwg.3/3

Abstract (Equivalent): US 5440109 A

The vehicle has a communication device, a vehicle transceiver and an **electronic purse** in the form of a processor card. Pay stations are arranged at locations along a roadway. The pay stations implement a data exchange with a wireless communication device and debiting a use toll. A vehicle localization device is provided in addition to a communication device at the pay station. The vehicle localization device identifies the position of the vehicle just arriving based on a brief-duration optical signal output by the vehicle transceiver wherein the temporary identifier known from the communication protocol is allocated to the optical signal.

The optical signal can be an infrared photoflash that is output on demand by the pay station. The vehicle localization device is an infrared-sensitive video camera that identifies the position based on the optical imaging of this vehicle with computer-controlled evaluation.

ADVANTAGE - Reliable, dependable communication.
